

EventForce Management System

Phase 2: Backend Development and Configurations

Implementation review: 3 October 2026 | Dedicated project playground

Objects and configuration

We configured six custom objects. Event has client and venue lookups, event date, type, status and a formula budget. Client email validation and the Feedback event lookup filter support data quality. The junction uses master-detail relationships to Event and Vendor.

Booking automation

EventForceTrigger calls EventForceService. It checks venue/date conflicts, validates the booking fields and synchronizes venue availability. Confirmed and Pending Cancellation events reserve venues. A venue marked Not Available retains that state.

Cancellation approval

The owner submits an event in Pending Cancellation status. The current user is the approved demonstration approver. Approval sets Canceled and rejection sets Rejected, matching the guide. Separate demonstration records verified both outcomes and approval history.

Notifications and scheduled work

The active reminder flow schedules an email three days before a qualifying Confirmed event. A 20 October event produced a 17 October scheduled path. A separate flow handles a change to Canceled. Scheduling and debug success do not establish actual inbox delivery.

Scheduled Apex

BatchCompleteEvents selects past events whose status is not Completed and changes them to Completed, including Canceled and Rejected events as specified in the guide. The daily 8 PM schedule was restored after the class update. Six project test methods passed after the change.

Evidence references
