

EventForce Management System

Phase 3: UI/UX Development and Customization

Implementation review: 3 October 2026 | Dedicated project playground

Application and navigation

We created the EventForce Lightning app with Events, Clients, Vendors, Venues, Feedbacks, Reports and Dashboards. Five custom object tabs use distinct icons. The implementation uses the EventForce app name for the team presentation.

Record interaction

Related client and venue fields keep event details together. Submit for Approval was added to the Event page layout and verified in the Lightning action menu. Record pages and approval history support the cancellation demonstration.

Report configuration

Upcoming Events by Month uses all events in the next 30 days except Canceled, groups by calendar month and summarizes record count and budget. Results change with the current date and record permissions.

Dashboard and review

EventForce Operations Dashboard uses a donut chart from the monthly report, a light widget theme and the subtitle Upcoming Events Overview. Screenshots show the saved interface. No separate mobile usability study is claimed.

Evidence references

See the corresponding implementation screenshots and testing results in the main EventForce Project Report. Evidence files: eventforce-lightning-app.jpg, eventforce-operations-dashboard.jpg.
