

EventForce Management System

Phase 4: Data Migration, Testing and Security

Implementation review: 3 October 2026 | Dedicated project playground

Import strategy

We imported parent records before dependent records and matched relationship names. Six CSV imports completed with zero failed rows. The checkpoint contained 10 Clients, 10 Venues, 10 Vendors, 13 Events, 10 Feedback records and 10 Event Vendor records, including existing demonstrations.

Test results

Final regression recorded four EventForceServiceTest methods and two BatchCompleteEventsTest methods passing. Separate cancellation approval and rejection demonstrations passed. Reminder scheduling showed the correct three-day offset. The observed scheduled execution completed with zero failures but no eligible records.

Security model

Event defaults are Private. Event Admin reports to CEO. Coordinator, Vendor Manager and Client roles sit below Event Admin. Profiles provide their specified object permissions. Feedback Manager adds Feedback create/read/edit/delete to the coordinator.

Sharing and report access

Event_Sharing_For_Vendors grants Vendor Manager Read Only access to events owned by the Event Coordinator role. The report folder grants View access to Event Coordinator and Vendor Manager. Saved assignments are evidence of configuration, not substitutes for user-session access tests.

Unverified acceptance checks

Actual inbox delivery and four separate user sessions remain unverified. No throughput or concurrency benchmark was measured. These outcomes must not be marked passed without observation.
