

EventForce Management System

Phase 2: Backend Development and Configurations

Updated 5 October 2026 | Team SWUID-2026-379743

KSK College of Engineering and Technology | College code: 8210

Team: Srinivasan J, Harish V and Subikshan C

Objects and configuration

We configured six custom objects. Event has client and venue lookups, event date, type, status and a formula budget. Client email validation and the Feedback event lookup filter support data quality. The junction uses master-detail relationships to Event and Vendor.

Booking automation

EventForceTrigger calls EventForceService. It checks venue/date conflicts, validates the booking fields and synchronizes venue availability. Confirmed and Pending Cancellation events reserve venues. A venue marked Not Available retains that state.

Cancellation approval

The owner submits an event in Pending Cancellation status. The current user is the approved demonstration approver. Approval sets Canceled and rejection sets Rejected, matching the guide. Separate demonstration records verified both outcomes and approval history.

Notifications and scheduled work

The active reminder flow schedules an email three days before a qualifying Confirmed event. A 20 October event produced a 17 October scheduled path. A separate flow handles a change to Canceled. Scheduling and debug success do not establish actual inbox delivery.

Scheduled Apex

BatchCompleteEvents selects past events whose status is not Completed and changes them to Completed, including Canceled and Rejected events as specified in the guide. The daily 8 PM schedule was restored after the class update. Six project test methods passed after the change.

Design model: Booking

This model follows the consolidated EventForceService source and distinguishes a blocking event from a venue reservation.

Venue and date validation decisions

Collect inputs

Gather venue IDs, event IDs and event dates for all incoming records.

Required details

Confirmed or Pending Cancellation requires client, venue and date.

Check stored events

Query relevant venue/date pairs while excluding records being updated.

Check current operation

Detect duplicate venue/date pairs within the same transaction.

Reject conflict

Add an error so the conflicting event cannot be saved.

Synchronize venue

Reserve for Confirmed/Pending Cancellation; preserve Not Available.

Canceled, Rejected and Completed records do not block a new booking. Planned records can block duplicate dates without reserving a venue. These rules are specific to the implemented code and should not be confused with the shorter reference examples.

Design model: Notifications

The two communication paths have different triggers. A reminder waits for a date-based scheduled path; cancellation communication responds to a status transition.

Reminder and cancellation timelines

Reminder entry

Confirmed event with required date, client and email.

Schedule

Event Date minus three days determines the reminder path.

Resolve content

Merge event, client and venue information into the message.

Send action

Client is the recipient; owner is copied in the reminder.

Cancellation path

A change to Canceled triggers the separate client notification.

Delivery evidence

Check the mailbox or delivery evidence before claiming receipt.

The saved example schedules 17 October for a 20 October event. It demonstrates the offset, not that a message has already arrived. Flow debugging, queue presence and inbox receipt must remain distinct in the test report.

Time-Based Automations

Help for this Page

Monitor the queue of pending automations. To filter the list, enter criteria before you click Search. The queue includes scheduled paths for record-triggered flows, schedule-triggered flows, time-dependent workflow actions, scheduled actions for processes built in Process Builder, and flow resume events.
