

EventForce Management System

Phase 5: Deployment, Documentation and Maintenance

Updated 5 October 2026 | Team SWUID-2026-379743

KSK College of Engineering and Technology | College code: 8210

Team: Srinivasan J, Harish V and Subikshan C

Delivery environment

The implementation remains in the dedicated Event Force Management System Playground. There was no production deployment. The supplied guide treats this phase as deployment preparation and documentation in the educational environment.

Source and documentation

Code Files contains the available Apex, trigger, tests, field metadata and sample CSVs. Project Document contains the implementation report. Phase-wise Documents contains these five records of work. The local source is a partial snapshot and requires a complete org metadata retrieval before a clean-org deployment can be reproduced.

Maintenance plan

Monitor Apex Jobs, daily schedules, failed flow interviews and scheduled reminder paths. Investigate email delivery separately from flow execution. Re-run regression tests after schema or Apex changes, review role access after staffing changes and keep evidence current.

Known limitations and future scope

The guide-specific batch also completes past Canceled and Rejected events. Production adoption should revisit that rule and the guide's non-expiring password policy. Potential extensions include client self-service, richer vendor notifications and a calendar view; these are not implemented features.

Submission checklist

Upload the current project PDF and five phase documents with the available code. Verify the repository link and submit it through SkillWallet. A live recording exists locally; final narration alignment and publication are separate delivery items and are not certified by these documents. Email receipt and complete role/sharing acceptance remain open.

Documentation revision

The main report is now 66 pages. It includes original design diagrams, nine fresh app screenshots, implementation procedures and explicit evidence limits. The appendix is followed immediately by THANK YOU; source listings were removed. These phase documents summarize the same implementation and do not claim a production deployment.

Design model: Future

These items describe possible improvements beyond the submitted educational implementation. They are not represented as features that have already been built.

From educational demo to future extension

Client experience

A self-service request and feedback portal.

Calendar planning

Date-specific venue availability and event views.

Vendor coordination

Assignment notifications and service tracking.

Deployment readiness

Complete metadata retrieval and environment-specific validation.

Operational resilience

Delivery monitoring and richer failure handling.

Policy review

Revisit password expiry and past-event completion semantics.

A future production design should preserve cancellation meaning when considering the nightly completion rule, validate security with representative users, and measure realistic workload behavior before making availability or scalability claims.
